Bitcoin Futures Trading: A Guide for Beginners

This is a complete guide on Bitcoin futures trading for beginners. Find out how Bitcoin Futures work and learn how to get started trading Bitcoin Futures on BTCC, one of the best crypto futures trading platforms.

What is Crypto Futures Trading?

Futures trading is derivative contract to buy or sell an underlying asset at a future date at an agreed-upon price. In the case of [bitcoin](#) futures, the underlying asset would be bitcoin.

Crypto futures give investors the opportunity to bet on the future price of cryptocurrencies without having to actually own or handle it. It allow investors to hedge against volatile markets and ensure they can purchase or sell a particular cryptocurrency at a set price in the future. Of course, if the price moves in the opposite direction a trader wishes, they may end up paying more than the market price for the cryptocurrency or selling it at a loss.

Apart from crypto futures trading, the asset might also be individual stocks, commodities like oil, exchange-traded funds or a range of others. Futures contracts can be used by many kinds of financial players, including investors and speculators, as well as companies that actually want to take physical delivery of the commodity or supply it.

S&P 500 futures contract, for example, is a kind of stock futures investing.

What are the Bitcoin Futures?

Bitcoin futures track the price movements of the world's largest crypto, Bitcoin. It gives investors the opportunity to bet on the future price of Bitcoin without having to actually own or handle it. Like traditional futures contracts, Bitcoin futures are legal contracts to buy or sell Bitcoin at a future date.

How Bitcoin Futures Trading Works

As with all other futures products, Bitcoin futures offer protection against volatility and adverse price movements. Also, it is a proxy tool for investors to speculate on the future prices of Bitcoin.

With a Bitcoin futures contract, you can take a long position if you expect the price of Bitcoin to rise. Conversely, you take a short position to reduce the impact of losses when the price of Bitcoin falls.

When investing for the long-term, Bitcoin may experience occasional bear markets as sentiments change. In this case, Bitcoin futures contracts can be useful to protect your Bitcoin investments against downside risk.

There are three main components to a Bitcoin futures contract:

- **Expiration date:** This refers to the date when the futures contract must be settled. In other words, one party has to buy, and the other has to sell at the pre-agreed price. It's worth noting, however, that traders can sell on their contracts to other investors before the settlement date if they wish.

- **Units per contract:** This defines how much each contract is worth of the underlying asset and varies greatly between platforms. For example, one bitcoin futures contract on CME equals 5 U.S. dollars worth of bitcoin, whereas one bitcoin futures contract on Deribit equals 10 bitcoins.

- **Leverage:** To increase the potential gains a trader can make on their futures bet, exchanges allow users to borrow capital to increase their trading size. Again, [leverage](#) rates also vary from platform to platform. Binance allows users to supercharge their trades by up to 100x, and BTCC offers leverage rates up to [150x](#).

There are also two different ways Bitcoin futures contracts can be settled:

- **Physically delivered:** Meaning upon settlement, the buyer purchases and receives bitcoin.

- **Cash-settled:** Meaning upon settlement, there's a transfer of cash (usually U.S. dollars) between the buyer and seller.

Benefits of Bitcoin Futures Trading

- **Leverage**

Bitcoin futures contracts enable you to gain leveraged exposure to Bitcoin with only a fraction of its total cost. With leverage, you can magnify relatively small price movements to create profits that justify your time and effort.

- **Flexibility**

Bitcoin Futures offers the flexibility for non-Bitcoin holders to speculate on the price of Bitcoin and make quick profits. You can open a position in a Bitcoin futures contract with USDT, and any profits made will be settled in USDT.

- **Liquidity**

Bitcoin futures are among the most liquid markets in the crypto economy, with trillions in monthly volume. A liquid market is generally associated with less risk because there is always someone willing to take the other side of a given position and traders will incur less slippage.

- **Diversified Portfolio**

With Bitcoin futures, you have more options to diversify across trading strategies to generate more profits. Traders can now develop sophisticated crypto futures trading strategies such as short-selling, arbitrage, pairs trading, etc.

Types of Bitcoin Futures

There are many Bitcoin futures markets today, and at BTCC, we offer Bitcoin futures trading through two flagship products: Bitcoin Perpetual Futures and Bitcoin Daily Futures, both of which are designed to cater to the specific needs of users.

[Bitcoin Perpetual Contracts](#)

[Bitcoin Daily Contracts](#)

These contracts differ in 2 main factors: Expiration Date and Funding Rate.

- **Expiration Date**

Bitcoin futures daily contracts allow a trader to buy or sell BTC at a predetermined price on a certain date. In other words, daily futures contracts have a limited lifespan and will expire based on a future date.

On the other hand, Bitcoin futures perpetual contracts, as the name suggests, do not have an expiration date.

- **Funding Rate**

Bitcoin futures daily contracts do not carry a funding fee, whereas Bitcoin futures perpetual involves funding rate.

Funding Rates are periodic payments made to or by traders. Since perpetual futures contracts never settle, exchanges use the funding rates to ensure that futures prices and index prices converge on a regular basis. BTCC takes no fees from such funding rates as they happen directly between users.
